Project Overview

This project transforms a raw OTT catalog dataset into an interactive Streamlit dashboard. The dashboard helps content, marketing, finance, and leadership teams analyze performance, engagement, profitability, and quality metrics.

Dashboard Home Page

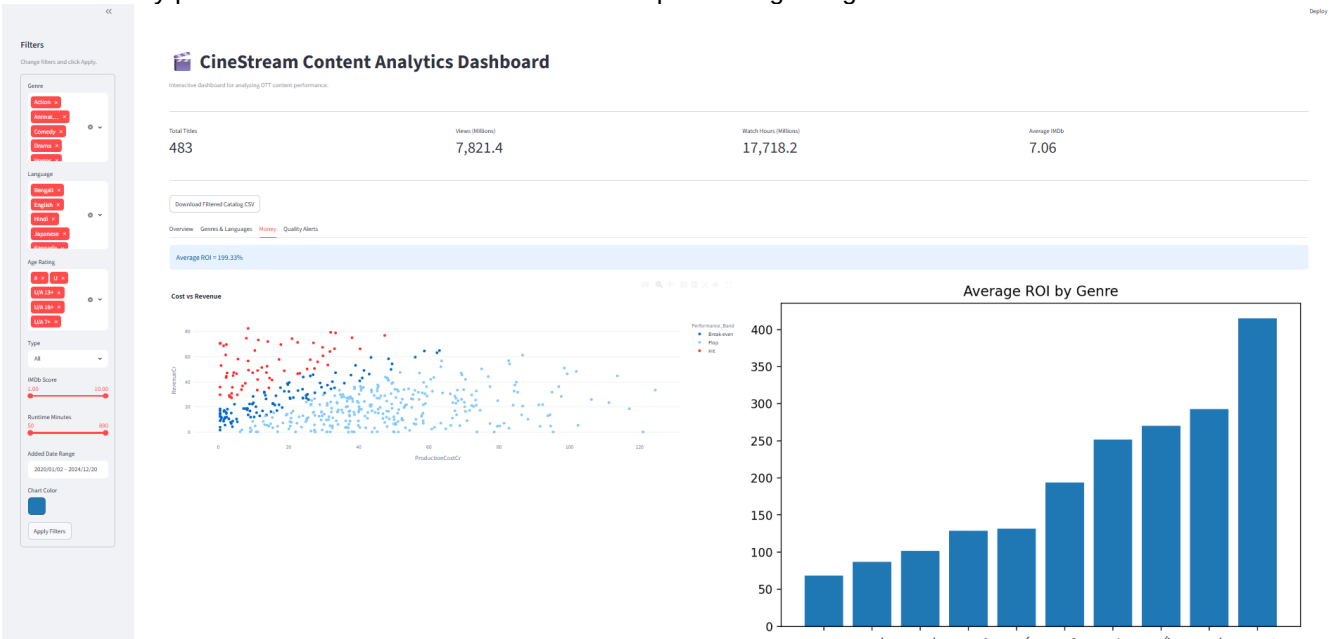

The Genres & Languages tab highlights the most-viewed genres and visualizes the relationship between languages and genres using a treemap. Thriller, Kids, Reality, and Action content show strong performance.

Genre and language analysis reveals which content categories generate the highest audience engagement. These insights can guide future acquisition and production decisions.

Money & ROI Analysis

The Money tab compares production cost against revenue and calculates ROI by genre. This helps identify profitable content investments and underperforming categories.

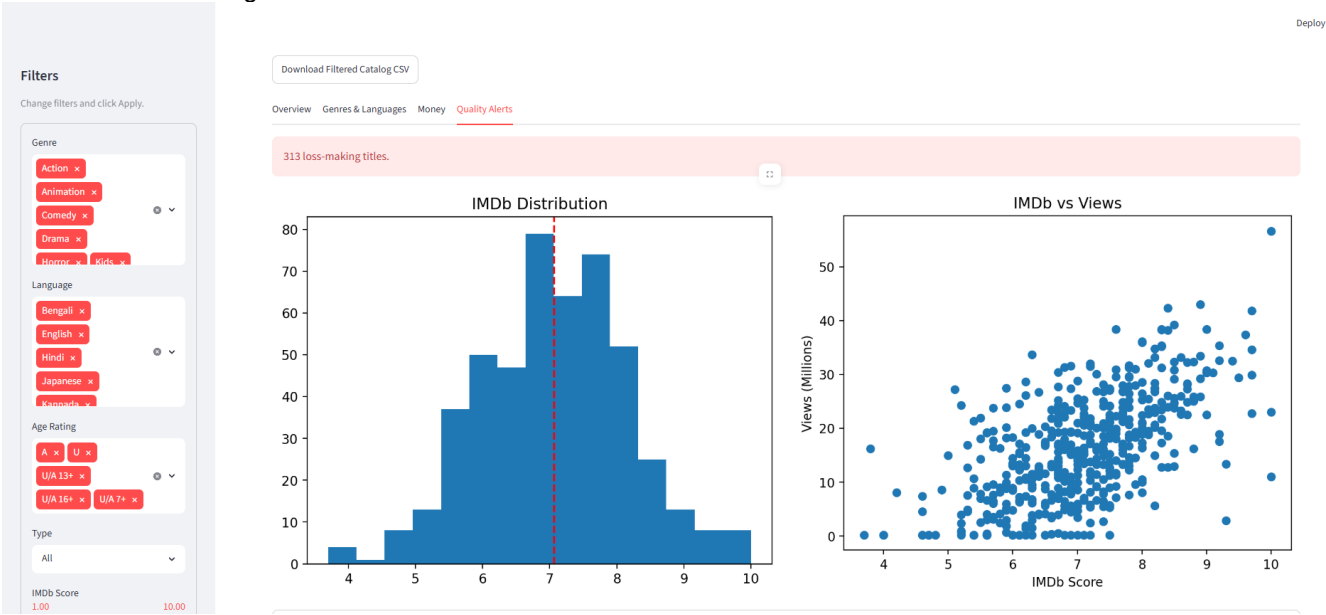

Business Insight 2

Higher production budgets do not always guarantee higher profitability. ROI analysis helps identify genres that generate strong returns relative to cost.

Quality Alerts & Ratings Analysis

The Quality Alerts tab monitors loss-making titles, IMDb score distribution, and the relationship between ratings and audience views.

Key Findings

- The dashboard identifies loss-making titles using Profit_Cr and ROI_Pct.
- IMDb ratings show a positive relationship with audience views.
- Interactive filters allow stakeholders to analyze specific content segments.
- KPI cards provide quick visibility into catalog performance.

Conclusion

The CineStream Content Analytics Dashboard successfully converts raw catalog data into actionable business insights. The project demonstrates data cleaning, analysis, visualization, dashboard development, and cloud deployment skills.
